

At **The GDM Island hotel**, we look after our planet just like we look after our guests – with great care. Therefore, we have assumed the following commitments:

- The automation of the air conditioning system of the hotel allows monitoring and rationalizing the consumption of electricity
- Systems of internal and external lighting are automated, depending on the availability of natural light and hotel bulbs are low energy consumption
- All hotel taps are equipped with water saving filter
- The laundry service is provided by an outside company. However, the hotel makes sure that all their suppliers have the necessary certifications regarding environmental sustainability
- The construction, architecture and design allow the hotel be completely integrated into the landscape and totally devoted to the environment. Therefore, buildings are not too tall, allowing regional planning through a proper framework landscape. Moreover, due to the large part of the guest rooms as well as all guestroom doors being glazed, and the existence of skylights, we make the most of natural light
- Being aware of renewable energy, the hotel uses central solar water heating
- Separation of all wastes into organic and recyclable is held all over the hotel departments and collection of used oil is provided by an outside certified company
- Internal communication in order to sensitize employees to the best practices for rationalization of energy is always present

We have also adopted a policy for our guests. We change your bed sheets and towels, every third day, in order to reduce water, waste and energy consumption. However, if you wish your towels changed, please leave them in the bathtub.

Thank you for understanding and participating in our efforts to help save our planet!!
